appear to be experienced outside of level-ground walking, with preliminary evidence suggesting that the intervention may assist with the performance of many important ADLs, with reduced tripping and fall rates being the most striking observations in this domain. An awareness of these findings will help clinicians guide the expectations of current and potential FES users who have MS.

Phil Stevens, MEd, CPO, FAAOP, is in clinical practice with Hanger Clinic, Salt Lake City, Utah. He can be reached at philstevens@hotmail.com
